APPENDIX A

Pseudo-Code for the Invention

```
/*
               Load existing document database into memory.
               The data structure used is a hash with each hash value pointing to a balanced tree
   5
               containing the ordered pair (Digest, DocId). The data structure is searched via the digest
               value. */
        DigestDB = LoadDocDB (dbname);
               Load the list of stop words to ignore and create a hash table.
  10
               -- This step is optional if the user does not desire stop word removal
                                                                                         */
        stopwordHash = LoadStopWordList (filename);
                Get a list of new documents to process.
                                                           */
        DocsToProcess = GetDocsToProcess (processlist);
   15
                Get first document to process.
                                                    */
        DocToParse = DocsToProcess.nextDoc();
TU 20
                Continue as long as there are documents to process */
        While ( DocToParse )
                       Create SHA1 Digest Object for current document
                SHA1 sha1 = new SHA1(); //
□ 25
                       Create Parser Object for current document */
₩
₩
□
□
□ 30
               Parser parser = new Parser(DocToParse);
                /*
                       The derived tree represents all the unique tokens from the current document.
                       The tree is ordered in Unicode ascending order
                Tree docTokens = new Tree();
                /*
                       Continue iteration for as long as there are tokens to process */
                for (;;)
   35
                            Get the next token from the document
                                                                          */
                       token = parser.getNext();
                              If there are no more tokes to process, exit loop
                                                                                  */
   40
                       if (token == null) break;
                       /*
                              Using term thresholds, retain only significant tokens.
                              If parts of speech are used, remove the ignored parts of speech.
                              In the pseudo-code, only the removal of stop words are illustrated. If
                              other text components are to be removed, they should be removed at this
